

Week 2 - Frame It as Cases

Voice Card

Clear, practical, curious, honest, no fluff.

Case Study

Project Title

Search Intelligence Capstone: Turning Search Data into Evidence-Backed Content Recommendations

Problem

Before starting this capstone, I noticed that people often create content based on guesses instead of actual search data. That leads to content that doesn't match what users are actually looking for. My goal is to explore how search intelligence and AI can turn search data into practical content recommendations backed by evidence instead of assumptions.

What I Did

I started by deciding which lane to focus on. I considered a few different directions, but chose the Search Intelligence lane because I wanted to understand how search data can be used to make better content decisions — not build another generic AI application, but learn how AI can analyze search patterns and generate recommendations grounded in evidence. That felt more practical and more aligned with the skills I actually want to develop in AI and data analytics.

From there, I explored the FlyRank search data and project resources to see what information was actually available. I wasn't trying to prove a conclusion at this stage — I was trying to understand the data first. One thing that stood out: context matters a lot. The same search topic can lead to very different recommendations depending on the underlying patterns, which confirmed for me that data-driven decisions are more reliable than guesswork.

Current Outcome

Right now, the capstone is in the research and planning stage. I've defined the problem, chosen the Search Intelligence lane, and started exploring the available search data and analysis approach. Next, I'm building a repeatable workflow for analyzing the data, validating what I find, and turning those insights into practical content recommendations. The goal is to finish with a research-backed case study that shows not just the results, but the decisions I made to get there.

Bio

I'm an engineering student and ML intern who likes figuring out how things actually work before deciding what to build. Right now I'm digging into search intelligence — how real search data, not assumptions, should drive content decisions. I'm drawn to practical AI/ML systems and to work where I can show my reasoning, not just a finished result.

Contact / Call to Action

Following how this capstone plays out? I'm sharing the process as I go, decisions included. Reach out if you want to talk search intelligence, AI-driven content, or compare notes on what you're building.

Before vs After

Before (Generic AI)

"Leveraging cutting-edge AI technology, I developed innovative, results-driven content strategies that maximize engagement and drive impactful outcomes."

After (My Voice)

"I noticed people were creating content based on guesses instead of real search data — so I'm exploring how search intelligence can turn that data into recommendations backed by evidence, not assumptions."
